

**RESPONSE UNDER 37 CFR 1.116
EXPEDITED PROCEDURE
EXAMINING GROUP 1745**

PATENT
Attorney Docket No. 400396/YPLEE

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re Application of:

CHANG et al.

Application No. 09/416,270

Filed: October 12, 1999

For: LITHIUM POLYMER
BATTERY

Art Unit: 1745

Examiner: T. Dove

RECEIVED
JUL 18 2002
TC 1700

**PENDING CLAIMS AFTER AMENDMENTS
MADE IN RESPONSE TO OFFICE ACTION DATED MAY 10, 2002**

7. A lithium polymer battery comprising:
a positive plate including a positive collector, comprising aluminum having a plurality of openings, and a positive active material layer on at least one surface of the aluminum;
a negative plate including a negative collector, consisting of a copper foil free of holes, and a negative active material layer on at least one surface of the copper foil; and
a separator located between the positive and negative plates, insulating the positive and negative plates from each other.

9. The lithium polymer battery of claim 7, wherein the positive collector is expanded aluminum.

10. The lithium polymer battery of claim 7, wherein the positive collector is punched aluminum.

11. The lithium polymer battery of claim 7, wherein the positive and negative active material layers are coatings of positive and negative active material slurries,

respectively, on at least one surface of the positive collector and at least one surface of the negative collector, respectively.

12. The lithium polymer battery of claim 7, wherein the positive plate includes the positive active material layer on both sides of the positive collector and the negative plate includes the negative active material layer on both sides of the negative collector.

13. A lithium polymer battery comprising a plurality of bi-cells stacked on each other, wherein each bi-cell comprises

- a positive plate including a positive collector, consisting of aluminum having a plurality of openings, a positive active material layer on both surfaces of the aluminum, and a positive tap electrically connected to the positive collector;

- a negative plate including a negative collector, consisting of a copper foil free of holes, a negative active material layer on both surfaces of the copper foil, and a negative tap electrically connected to the copper foil; and

- a separator located between the positive and negative plates, insulating the positive and negative plates from each other, wherein the positive taps of the bi-cells are connected together as a first terminal of the battery and the negative taps of the bi-cells are connected together as a second terminal of the battery.

15. A lithium polymer battery comprising a plurality of bi-cells stacked on each other, wherein each bi-cell comprises

- a positive plate including a positive collector, comprising aluminum having a plurality of openings, a positive active material layer on both surfaces of the aluminum, and a positive tap electrically connected to the aluminum;

- a negative plate including a negative collector, consisting of a copper foil free of holes, a negative active material layer on both surfaces of the copper foil, and a negative tap electrically connected to the copper foil; and

- a separator located between the positive and negative plates, insulating the positive and negative plates from each other, wherein the positive taps of the bi-cells are connected together as a first terminal of the battery and the negative taps of the bi-cells are connected together as a second terminal of the battery.

18. The lithium polymer battery of claim 13, wherein the positive collector is expanded aluminum.

19. The lithium polymer battery of claim 13, wherein the positive collector is punched aluminum.

20. The lithium polymer battery of claim 13, wherein the positive and negative active material layers are coatings of positive and negative active material slurries, respectively, on at least one surface of the positive collector and at least one surface of the negative collector, respectively.

21. The lithium polymer battery of claim 13, wherein the positive plate includes the positive active material layer on both sides of the positive collector and the negative plate includes the negative active material layer on both sides of the negative collector.
